

SHUBHAM LAKHANI

Senior Full-Stack Engineer

Surat, India (Remote) | lakhanishubham9750@gmail.com

LinkedIn: www.linkedin.com/in/shubham-lakhani-677b00209 GitHub: <https://github.com/ShubhamLakhani>

SUMMARY

Senior Full-Stack Engineer with 6+ years building and operating production web applications in TypeScript, React, and Node.js. Work end to end: scoping problems directly with founders and customers, modelling the data, building the API and interface, then containerising, deploying, and monitoring it in production. Owned the Veterinary Management module at HappyPet Tech through September 2026, on a SaaS platform serving approximately 100+ veterinary clinics. Remote-first for the last four years with distributed teams across the US, UAE, and India.

TECHNICAL SKILLS

Languages TypeScript, JavaScript (ES6+), SQL, HTML5, CSS3

Frontend React.js, Next.js, Redux Toolkit, Tailwind CSS, Bootstrap, Responsive Web Design

Backend Node.js, Express.js, REST API design, Socket.IO, OAuth 2.0, Payload CMS

Databases PostgreSQL, MySQL, MongoDB, data modelling, schema design, indexing, query optimisation

Cloud and DevOps AWS (EC2, S3, Lambda), Docker, CI/CD with GitHub Actions, Azure

Reliability Sentry, production monitoring and alerting, Jest, automated testing, code review

Practices Agile, product scoping with founders, mentoring

PROFESSIONAL EXPERIENCE

Senior Full-Stack Engineer | Apr 2025 - Sept-2026

HappyPet Tech, Surat, India (Remote) - Veterinary Management SaaS

- Shipped the Veterinary Management (VMS) module end to end - pet health records, vaccination tracking, and clinic operations - now serving 100+ clinics and 200+ bookings per month, by owning the work from product scoping with the founders through TypeScript implementation, containerised deployment, and ongoing production support.
- Cut booking-status propagation between clinic and customer portals from a polling interval to sub-second, measured by end-to-end sync latency, by replacing the polling loop with a Socket.IO event layer that pushes state transitions to both sides on write.
- Automated build, test, and deployment for the Next.js and Node services, measured by deploy frequency and failed-deploy rate, by containerising them with Docker and running the pipeline through GitHub Actions onto AWS EC2.
- Shortened detection time on production incidents from user-reported to alert-driven, measured by time-to-alert on failed bookings and payment errors, by instrumenting the application with Sentry and defining alert thresholds across the booking, payment, and vaccination-verification paths.
- Removed a recurring class of state-desync defects across the clinic and customer dashboards, measured by the drop in QA-reported state bugs, by consolidating global state into a typed Redux Toolkit store with TypeScript interfaces defined for every API contract.
- Kept payments, Payload CMS, and AWS S3 and Lambda integrations stable through repeated provider-side changes, measured by failed-webhook rate, by building a typed integration layer with schema validation and retry-with-backoff on every outbound call.

Freelance Senior Full-Stack Engineer | Jun 2022 - Jan 2025

Independent contractor - long-running product engagements for international clients

Orbofi, Dubai (Remote) - AI Chatbot Creation Platform | React.js, Redux, Node.js, MongoDB, Web3

- Took an AI chatbot platform from empty repository to production launch serving 500+ users, as part of the founding engineering team, by architecting the entire front end from scratch - application structure, component library, routing, and state layer.
- Reduced UI load time by approximately 35%, measured by time to interactive on the chatbot builder, by profiling React render behaviour and applying memoisation, code splitting, and lazy loading to the heaviest component trees.
- Owned user management and third-party authentication end to end, measured by signup completion rate, by designing the Node.js and MongoDB service layer and implementing OAuth 2.0 across Google, Facebook, and Twitter.
- Made streamed AI responses feel conversational rather than mechanical, measured by time-to-first-token, by building a token-level typewriter renderer over the streaming model output.

IntelliFlow, Bengaluru (Remote) - Low-Code Application Platform | React.js, Redux

- Enabled non-technical users to build working applications without writing code, measured by the volume of apps created on the platform, by developing the drag-and-drop component canvas and customisation workflows.
- Improved interaction responsiveness across the builder modules, measured by frame time during drag operations, by restructuring the component tree and eliminating unnecessary re-renders.

Full-Stack Engineer (6-month contract) | Jan 2022 - Jul 2022

247 Software (Remote) - Facility Management and Incident Tracking SaaS

- Cut incident report latency by approximately 40% for enterprise venue, stadium, and security operations teams, measured by the time from an incident being logged to appearing on the operations dashboard, by restructuring the data synchronisation between the front end and the backend reporting services.
- Owned data modelling for the incident and activity tracking domain in MySQL, measured by query time on the incident table and end-to-end report generation time, by designing the table relationships and indexing the timestamp and venue-ID access paths.
- Led front-end delivery of the Incident Management and Activity Tracking modules, by building a custom grid system and a real-time Leaflet.js mapping interface that plotted live incidents against venue floor plans.

Senior React.js Developer | Nov 2020 - Nov 2021

White Orange Software, Surat

- Delivered Gamezzar, a digital game-key marketplace, from requirements through launch, by owning both the React front end and the Node.js and Express APIs, including payment and key-delivery integration.
- Shipped production applications including Gamezzar and Morning Crate - by building full-stack features end to end against a MySQL data layer.

React.js Developer (Intern to Full-Time) | Oct 2019 - Nov 2020

Depthin Solution, Surat

- Converted from intern to full-time developer, by taking ownership of production React and Node.js work on Accelevents, an event management platform.
- Improved usability across the Accelevents registration and check-in flows, measured by reduced drop-off during event sign-up, by rebuilding the front-end components and resolving cross-module interaction defects.

EDUCATION

Bachelor of Computer Application | Veer Narmad South Gujarat University (VNSGU), Surat | 2014 - 2017
